

Food chain (simple)

Definition:

- A food chain shows who eats whom: sun → plant → herbivore → carnivore.

Explanation:

- Energy flow starts with the sun; plants (producers) make food; herbivores eat plants; carnivores eat herbivores. Simple chains show direct links; food webs are many connected chains. Stress that energy decreases with each step.

Examples:

- Sun → grass → rabbit → fox. Sun → algae → small fish → bigger fish.

Activity:

- Build a classroom food chain poster using local examples. Ask: if rabbits disappear, what happens to foxes?
-

Life cycle (butterfly, frog)

Definition:

- Life cycle = stages an organism passes through from birth to reproduction to death.

Explanation:

- Butterfly: egg → caterpillar (larva) → pupa (chrysalis) → adult. Frog: egg → tadpole → tadpole with legs → froglet → adult. Use visuals to show dramatic body changes (metamorphosis).

Examples:

- Show pictures or short videos of each stage.

Activity:

- Observe caterpillars (real or via video) through metamorphosis or sequence cards for frog life cycle.
-

Sense organs

Definition:

- **Organs (eyes, ears, nose, tongue, skin) that collect information from the environment.**

Explanation:

- **Each organ detects a type of stimulus: eyes → light/see, ears → sound/hear, nose → smell, tongue → taste, skin → touch/temperature/pain. Teach safety: senses warn us of danger (hot, sharp, smell of smoke).**

Examples:

- **Smell of food, sound of bell, taste of salt.**

Activity:

- **Blindfold taste test (safe foods) and sound identification games to illustrate senses.**
