

Definition & Explanation:

- **Root:** absorbs water/minerals, stores food (in some plants). **Stem:** holds plant up and carries water/nutrients up and down. **Leaf:** site of photosynthesis and gas exchange. Explain water transport from roots to leaves and the role of stomata.

Examples:

- Carrot is a root that stores food. Cactus stem stores water. Large leaves (banana) catch lots of sunlight.

Activity:

- Celery/water + food-color experiment: put celery stalk in colored water and watch color move into stem and leaves.
