

Grade 2 – Science

Topic: Photosynthesis

Advanced Level

Explanation:

- Photosynthesis is a chemical process that converts light energy into food energy.
- Chlorophyll in the leaves traps sunlight.
- Plants combine water (from roots) and carbon dioxide (from air) using sunlight to produce glucose (food).
- Oxygen is released as a by-product of this process.
- Photosynthesis is important because it supports almost all life on Earth.

Examples:

- Glucose gives energy to the plant for growth.
- Animals depend on plants directly or indirectly for food.
- Without photosynthesis, there would be no oxygen for living beings.

Learning Outcome:

- Describe the steps of photosynthesis clearly.
- Explain why photosynthesis is important for life.
